READ THIS

The structure of the *Catalog of Infrared Observations* is unconventional. Please note the following special characteristics:

1) **Sky coverage is not uniform.** The catalog data are a mixture of sky surveys, small-scale region surveys, and numerous individual source observations. The whole sky has been surveyed only at a few wavelengths, and then to different levels of sensitivity. Non-survey observations are not spatially homogeneous.

2) **Data are presented in original published form.** No attempt has been made to create a single system of infrared photometric units, or to eliminate redundant observations. This kind of interpretation is more appropriately done by the individual researcher.

3) **The Catalog is as accurate as the published data** from which it was constructed. Observations listed here were made by hundreds of investigators, using different instrumental techniques and methods of analysis.

The user of this catalog must therefore approach it with the same kind of professional skepticism which would be applied to the original journal articles.

Inquiries and comments regarding the contents of the catalog, and requests for copies of the catalog and data base in printed, microfiche, or magnetic tape form should be directed to:

Dr. Daniel Y. Gezari
Infrared Astrophysics Branch, Code 685
NASA/Goddard Space Flight Center
Greenbelt, MD 20771

(301) 286-3432

HOW TO USE THIS CATALOG

1) Sources are listed by position: The catalog observations are arranged in order of increasing right ascension, then declination, then by the wavelength of the observation; **not** by source name. The position of a source can be found in the Source Index at the back of this volume (Appendix D).

2) Multiple source names: The same source is often listed under several different names in the catalog (because it was renamed in several surveys, or by different observers). Check nearby source names for additional data on the source. The *Infrared Source Cross-Index* (NASA RP 1182) can be used to identify source name aliases listed in the CIO.

3) Infrared and “nominal” positions: The catalog lists published source positions, and also “nominal” positions. When the original articles do not specify the observed infrared positions (for well-known visible objects, for example), the positions listed are taken from a variety of standard catalogs. The nominal positions are the best available, but are not a published infrared observational result.

4) Multiple source positions: Check nearby positions on the page. Very often, the same source is listed at several different positions in the catalog (because observers report different positions, or because positions are published with differing precision).

5) Accuracy of catalog data: The catalog data are presented “as published” in the original articles. Always refer to the original article when interpreting catalog data listings. Use the bibliographic reference number given for each observation to identify the original journal article in the *Bibliography of Infrared Astronomy* (Appendices B and C).

INTRODUCTION

1. Changes in the Third Edition

The Third Edition of the *Catalog of Infrared Observations* (CIO) differs from the Second Edition (NASA RP 1196) in three significant ways: 1) the data base has been updated, and the Catalog is now complete for 1965 through 1990; 2) this edition of the Catalog is produced as a single volume; 3) the main Catalog contains four appendices familiar from the First Edition, but the *IRAS Data Appendix* has been removed and will be published as a separate document (see Section 3).

The current extent of the literature is summarized in Table 1. To date, about 4100 journal articles and 10 major survey catalogs have been included in this data base, which contains over 206,000 individual observations.

2. Goddard Infrared Astronomical Data Base

The data base from which the *Catalog of Infrared Observations* is constructed, comprises a machine-readable library of infrared ($1\mu\text{m}$ – 1mm) astronomical observations published in the scientific literature from 1965 through 1990. The Goddard Infrared Astronomical Data Base, maintained at NASA/Goddard Space Flight Center, contains infrared observational data for astronomical sources outside the solar system compiled through a search of the most active astronomy journals, infrared surveys, and catalogs (see Table 1).

A magnetic tape library contains all of the observational data, bibliographic reference information, object name aliases, and stellar catalogs (for supplementary position determinations). A library of FORTRAN and C language programs (used to access and process the data) and a file of journal article photocopies are maintained as part of the data base.

3. IRAS Data in the Third Edition

The large number of sources (245,000) in the IRAS Point Source Catalog (PSC) would clearly overwhelm the CIO. Criteria had to be established to include IRAS PSC data without changing the basic nature of the CIO.

Order-of-magnitude IRAS PSC fluxes have been included for all CIO sources which were also detected in the IRAS PSC Version 1.0 (about 15,000 of the individual infrared sources listed in this edition of the CIO).

A four-digit code summarizing the four IRAS band fluxes is given in the main catalog listings (see Section 5, below). IRAS source names appear in the NAME column of the Catalog only when IRAS sources were subsequently observed by other observers and the results published in the literature under the IRAS name.

The identifications of CIO sources with PSC sources were based on source identifications made in the IRAS Point Source Catalog, correlated infrared source names and aliases in the *Infrared Source Cross-Index* (NASA RP-1182) data base.

4. Appendices to the Catalog

Four appendices to the main Catalog provide information critical to the full use of the document. The *Bibliography of Infrared Astronomy* links observations in the Catalog with the original articles published in the astronomical literature. Approximately 4400 infrared journal articles and other references are listed in this appendix. The Bibliography is arranged both chronologically (Appendix C) by reference number, and alphabetically by first author (Appendix B).

The *Atlas of Infrared Spectral Ranges* (Appendix A) summarizes the wavelength range of published spectra for individual sources, since plotted spectra cannot be readily included in the automated data base. It lists the name, starting and ending wavelengths, and bibliographic reference number for each published infrared source spectrum.

The *Index of Infrared Source Positions* (Appendix D) is the key cross-reference between infrared sources and positions, arranged alphabetically by source name. The position of a source can be found from its name, and it can then be easily located in the Catalog (organized in

TABLE 1: LITERATURE INCLUDED IN THE DATA BASE

The Catalog contains observational data obtained from a search of the following infrared catalogs and scientific journals for the years 1965–1990, inclusive. The number of articles in each journal containing infrared astronomical data and the journal abbreviations used in the bibliography are indicated.

Scientific Journals Searched (1965–1990, complete):

366	Astronomical Journal (A.J.)
670	Astronomy and Astrophysics (Astr. & Ap.)
61	Astronomy and Astrophysics Supplement (Astr. & Ap. Suppl.)
1335	Astrophysical Journal (Ap. J.)
558	Astrophysical Journal Letters (Ap. J. Letters)
69	Astrophysical Journal Supplement Series (Ap. J. Suppl.)
607	Monthly Notices of the Royal Astronomical Society (M.N.R.A.S.)
178	Publications of the Astronomical Society of the Pacific (P.A.S.P.)

Publications of the Astronomical Society of Japan (P.A.S.J.)
Science
Tokyo Astronomical Bulletin (Tokyo Ast. Bul.)
Zeitschrift für Astrophysik (Zeit. für Ap.)
Soviet Astronomy (Sov. Ast.)
Soviet Astronomy Letters (Sov. Ast. Letters)

order of increasing right ascension). When published articles do not include the position of the observed source, the editors have provided nominal positions obtained from other data bases. The nominal positions are the best available, but in a few cases may not have been determined by infrared measurements.

5. Explanations of Catalog Columns

“NAME” – *Source Name*: It is common for an astronomical source to be listed by several different names in the Catalog, since the observations are presented “as given” by the original authors. In general, source names should be given secondary importance when searching the Catalog listings, with positions given priority. Source names and positions are cross-referenced in the *Index of Infrared Source Positions* (Appendix D). Source names are sometimes abbreviated (see Tables 3, 4, and 5). In some cases the names are augmented by the editors (for example, when the original author assigns the source a number but no identifying prefix).

“RA (1950) DEC” – *Position*: The accuracy of the positional data in the Catalog reflects that of the data published by the original author. This is true primarily for visible sources with well-documented positions. In such cases, the “nominal” source position is entered in the position field by the editors. When authors omit specific source positions from their articles, they must presume that the position is common knowledge, to be found in the appropriate standard catalog. When no position can be obtained by the editors, all such entries are sorted alphabetically by source name and are listed at the end of the Catalog. Positions for objects that can be located within a general area of the sky (e.g., individual stars around a globular cluster) have a dash (–) in the position field with nominal central position given above the dashed entries.

“ λ (μm)” – *Wavelength*: The wavelength of the observation is given in units of micrometers (μm). Catalog entries having the same celestial position are listed in order of increasing wavelength. Thus, a rough spectral distribution appears for each well-observed source position. The “ λ (μm)” column data can also be used as a visual indication of the change to a new source, since the

wavelength listing will “reset” to the lower value. Although the inclusion criteria for the Goddard Infrared Astronomical Data Base specifies a wavelength range of from 1 μm to 1 mm, some Catalog entries have wavelengths outside this range. Wavelengths shorter than 1 μm would indicate that a spectrum exists in the article starting at this wavelength and extending into the infrared. A few observations made at wavelengths greater than 1 mm have been included when the observation was essentially done with far-infrared techniques (some broad-band submillimeter observations).

“FLUX” – *Infrared Flux*: The infrared flux is listed in the same units as published by the original observers. The units have been given one-letter abbreviations (see Table 2 and the inside front cover). Upper limits are listed in italics. To protect the integrity of the data base, no attempt has been made to convert these different units of infrared flux into a more homogeneous system. Fortunately, about 95% of the flux observations in the catalog have units of “magnitudes” or “Janskys,” or have comments such as “polarization data,” “spectrum,” etc. An additional 3% of the entries are in five other commonly used units (B, E, F, I, X). The remaining 2% of the entries are in less common units, but which are dimensionally equivalent to one of the more commonly used units. In general, infrared magnitudes are calibrated with respect to the flux density of α Lyr (10^4 K black-body), which is defined as being 0 magnitude at all infrared wavelengths (see Gillett *et al.*, 1971, *Ap. J.*, 164, 83; Gehrz and Woolf, 1971, *Ap. J.*, 165, 185). The following symbols sometimes occur next to values in the “FLUX” column: V = variable, (or mean of several values), L = lower limit (detector saturated), and E = editors determined flux from maps, spectra, or other material in the article presented in non-tabulated form. When spectral data (S) are listed, only the starting wavelength of the spectrum is given in the “ λ (μm)” column. Starting and ending wavelengths of published spectra are given in Appendix A.

“BEAM” – *Beam Size*: The angular beam size of the observation is presented in degrees ($^\circ$), arcminutes ($'$) or arcseconds ($''$). If no beam size information was given in the original reference, a dash (–) is entered. In addition to being a factor in source brightness calculation, the

TABLE 2: ABBREVIATIONS FOR PUBLISHED FLUX UNITS

154	X = 10^{-18} W cm ⁻²
18	Y = relative line intensity
5	Z = 10^{-21} W cm ⁻² μ m ⁻¹ arcsec ⁻²

* This column indicates the total number of journal articles using each unit.

beam size can be used as an aid in determining positional coincidences and identifications with other sources, and as a first-order indication of positional accuracy.

“BIBLIO” – Bibliographic Reference: The bibliographic reference number identifies the original journal article for each observation in the Catalog, keyed to the chronological version of the *Bibliography of Infrared Astronomical Literature* in Appendix C. The bibliographic reference number is made up of the year and month of publication, and a sequential number is assigned to the article (for example, “790104” breaks down into 79–01–94, where 79 = 1979, 01 = January, and 04 = article randomly assigned as #4 in that month). References in the data base, but not containing infrared observations have an “89” or “99” as the month of publication. An “89” means that the reference was

published in the nineteenth century. References that do not indicate the month of publication have “00” in the month field.

“IRAS” – IRAS Data: For each CIO source detected by IRAS, the corresponding order-of-magnitude IRAS PSC flux is given using four digits, representing the approximate logarithm of the flux density in each of the four IRAS bands. For example, “0012” means that the source listed has fluxes of roughly 1, 1, 10, and 100 Janskys in IRAS Bands 1, 2, 3, and 4 (12, 25, 60 and 100 microns), respectively. The numbers used in this notation are specifically 0 = 0.5–5 Jy, 1 = 5–50 Jy, 2 = 50–500 Jy, 3 = 500–5000 Jy, etc. This allows the user to get an immediate estimate of the IRAS PSC fluxes in a compact format. Upper limits in the IRAS fluxes are listed in italics.

ACKNOWLEDGEMENTS

The editors are grateful to Dr. Michael Hauser at NASA/Goddard Space Flight Center and Dr. Larry Carroff at NASA/Headquarters for their support of the Catalog and data base program. It is a pleasure to acknowledge the important contribution made by Luann Bindschadler in the Goddard Publications Office toward the success of this project. We especially thank Edwin Treine and Jennifer Mark of the Government Printing Office for applying their expertise to the computer typesetting of the Catalog listings and Appendices. Data entry and software support were provided by Rebecca Castiglione,

Diana Panagotacos, Ann Dougherty, Corrie Eby, Denise Proctor, Patricia Lawton, and John Wilder of Computer Sciences Corporation. We gratefully acknowledge the support of the Technical Assistance group at NASA's Center for Computational Sciences. This research has made use of both the NASA/IPAC Extragalactic Database (NED), and the SIMBAD database, operated at CDS, Strasbourg, France. This work is supported by the NASA/HQ Office of Space Science and Applications, Astrophysics Division, and the NASA/Goddard Space Flight Center.
